

# Pond Design and Construction

Adding water to a property enhances its value by providing recreation as well as retaining water on the property for livestock use. We have built ponds as small as 35'x40' within a fenced yard, repaired existing ponds and built large ponds covering many acres.

## Pocket Sized

Before

After

This fenced yard of sparse grass became a pocket paradise filled with fish accompanied by the gentle murmur of the of the “Mini-colola stream”.

## Medium Sized

First cut to locate spring

Pond before seeding

This landowner raises horses and wanted to turn the boggy spring seep in his pasture into an asset and catch the spring runoff from his pasture in a pond to provide a safe watering hole and irrigation for his garden.

## Pond Design Instruction

### Larger Size

This pond was built for the Army as part of a Wetland Mitigation Project in 2001 and has developed a peaceful character. Unfortunately, I do not have a picture of the original site showing the corn field that became this beautiful pond.
